Silk Poems: Jen Bervin

UMAG

[Scroll down to read more](#)

Silk's cultural history spans more than 5,000 years. Examples of sericulture appear in the Chinese archaeological record as early as the third millennium BCE, and silk fabrics excavated from sites have been dated to at least the Shang dynasty (1600–1046 BCE).

Beyond silk's traditional use in textiles and as a valuable trade commodity, biomedical researchers are now experimenting with the material in novel forms of technology; since silk is compatible with human tissue, the immune system can accept silk on surfaces as sensitive as the human brain.

In the UMAG exhibition Silk Poems, visual artist and author Jen Bervin has merged the medium's traditional applications with cutting edge research—engaging with silk's cultural, scientific and linguistic complexities.

UMAG gratefully acknowledges Creative Capital and the U.S. Consulate General Hong Kong and Macau for their generous support of Ms Bervin and the Silk Poems project.

Jen Bervin holding a silk cocoon and silk film

Silk Poems began as a six-year research project developed with expertise from more than thirty international textile archives, medical libraries, nanotechnology and biomedical labs, and sericulture sites. Jen Bervin first visited the Bioengineering Department at Tufts in 2010, where David Kaplan and Fiorenzo Omenetto were working on a new form of the material—reverse-engineered liquefied silk. Among the research outputs from the Tufts group has been a silk biosensor etched nanoscale on clear silk film that can be implanted in the body to provide diagnostic readings.

Using this research as a springboard, Bervin started to write a poem to be inscribed on a silk biosensor. The poem acts as a talisman, written from the perspective of the silkworm, addressed to the person with the biosensor implanted in their body. From this evolved the first few elements of the Silk Poems project—an etched version of the poem viewed through a microscope, Charlotte Lagarde's short film and book published by Nightboat Books.

The inaugural display of work related to Bervin's Silk Poems was as part of a group show at MASS MoCA (May 2016–April 2017). The solo exhibition of Silk Poems at UMAG (November 2019–February 2020) was staged as part of the 10th anniversary celebration of the IPNHK literary festival.

II. Poetry at Nanoscale

Nanoscale science is concerned with physical interactions at extremely minute dimensions—one nanometer is equal to one-billionth of a meter. A strand of human DNA is 2.5 nanometers in diameter, while a sheet of paper is nearly 75,000 nanometers thick. Nanostructures can be made by reacting chemicals in liquids or gasses, or by etching with electrons. In nature, the iridescent colors of some butterfly wings contain nanostructures that affect light waves.

[fullscreen](#)

Detail of poem strand suspended in silk film, microscopic view of letters

In 2016, Bervin began working with Tufts' scientists on fabricating her poetry at nanoscale. In this process, a mask is used to etch the poem in gold spatter onto a silicon wafer, and then liquid silk is poured over the wafer. As the silk dries, the letters remain suspended in the film. The etched version of Bervin's poem could be viewed at the exhibition's microscope station.

Photograph of poem through the microscope

[fullscreen](#)

Photograph of poem through the microscope

Bervin's poem is modeled on silk at the DNA level—the six-character repeat of the silk genome is the basis for the poem's six-letter line. The shape of the strand reflects both the filament pattern that silkworms create when making their cocoons and the genetic structure of silk, which forms like the weft thread in weaving.

Silkworm patterned filament in a cocoon

[fullscreen](#)

Silkworm patterned filament in a cocoon

Ongoing research includes scientists dating the genetic split between domestic silkworms and their wild cousins (*Bombyx mandarina*), as well as a focus on altering the genetic code of silkworms to create fibers from cocoons that can be woven into a material stronger than steel and more flexible than Kevlar. Other recent innovations involve developing materials from silk fibers that are naturally antimicrobial, and the fabrication of silk screws for stabilizing broken bones.

III. Sericulture and Traditions in Silk

Sericulture refers to the production of silk fibers through the domesticated farming of silkworms. Chinese legend attributes the origins of sericulture to the wife of the mythical Yellow Emperor, Lady Xiling, around 3000 BCE. Recent archaeological discoveries suggest that silkworms were domesticated in China as early as 3500 BCE.

Silkworms feeding on mulberry leaves

[fullscreen](#)

Silkworms feeding on mulberry leaves

Silkworm (*Bombyx mori*) caterpillars feed exclusively on mulberry leaves (*Morus*) which contain a type of latex toxic to other herbivores. The silk is produced as long fibers excreted as a gel during the larval stage. These fibers create the cocoon that silkworms use when transforming into moths. To collect the silk fibers, farmers unravel the cocoons; when unwound a single cocoon can stretch from 100 to 300 meters long.

Silk as a traditional medium for writing dates back to at least the seventh century BCE, while references in the Confucian Analects and other Zhou dynasty works suggest an even earlier origin for texts written on silk. Oracle bone script on Shang dynasty turtle plastrons and ceremonial bones often include inscriptions for a core group of animals and goods, such as silk, silkworm, book and writing brush.
